RACKING PROTECTION

Protect essential warehouse racks and storage infrastructure from impact damage and downtime with A-SAFE racking protection.

Protect your racking

Damage to racks

Impacts from vehicles, palletted goods and materials handling equipment can damage and weaken warehouse racking

Quarantined racking

Damaged quarantined racks cause operational disruption and costly warehouse downtime.

Racking collapse

Cumulative racking damage or heavy impacts can result in catastrophic racking collapse

Why choose polymer racking protection?

No floor damage

Flexible industrial polymer and patented engineering absorbs and disperses impact forces to protect fixings and prevent floor damage

Save on repairs

Engineered with built-in memory to flex and fully recover from impacts, unique polymer design protects against costly barrier and vehicle damage.

Save on maintenance

Self-coloured, non-corrosive and UV protect, advanced polymer barriers stay visible, do not rust and never need painting, saving you time and money.

Keeping your racking safe from damage

Protect vulnerable rack ends

Turn point at the end of racking aisles can be impact hotspots. Rack end barriers and bollards can soften sharp corners and deflect frequent glancing blows from turning forklift trucks. Our warehouse safety expert will help to identify high-risk zones in your facility.

Prevent damage to rack legs

Rack guards prevent impact and scrape damage to the front and sides of rack legs during loading and unloading. The health and structural integrity of every rack leg can be monitored and analysed 24/7 by the A-SAFE Rack Eye system, providing real-time damage detection and around-the-clock visibility.
